**Changelog:**

After some discussion and reviewing, we decided that prototype B was the better route to go for the design of our app. The main difference in this prototype was on the profile page, where we had all the profile statistics on different tabs on the profile page, as opposed to having all the stats on one single page. A big driver for making this change was the results from our prototype testing. Several of our testers thought that the view with several tabs made the view look much cleaner, as well as less overwhelming.

Usability Issue	How it was Fixed
No feedback on what tab user is currently	This was a simple fix. We simply highlighted the current tab that the user was on, and it made the design look much better
Confusion between tab meanings	This problem primarily occurred in reference to the home button and the sponsor button, as people thought the sponsor button was actually the profile button. In an attempt to change this, we changed the sponsors button to be a picture of several people instead of just one, to imply that it is not a page for the user. It is a subtle change, but we feel like it will communicate the difference between the tabs.
Not attention grabbing	Another relatively simple fix. We changed the background color of the app to a light blue, and made the text white in order to make the text and statistics easier to read.
Minimize user's memory load/user knowing what to do in the app and how to navigate	This was a problem that we hoped would be fixed by our highlighting the tab the user is currently on. Our hope is that by highlighting the current tab, the user will notice this and will recognize that the tabs are how they can navigate through the app.

**Section that our storyboard was brought to:**

103 (Friday, 12 PM).

**Who presented:**

Sam

**Feedback:**

None. TA did not have time to give feedback to groups, as there were too many to present.
